

Q In Java every object has ~~it~~ ^{what is} code find out ~~it~~ ^{code} and why it is being generated in Java

→ What is hash code? - It is an integer value that represents an object. It is mainly used to identify objects efficiently in hash-based collections. Such as Hash map, Hash Set, Hash table.

→ Why it is generated? to improve searching speed, helps compare objects efficiently, determine the bucket

```
Ex: class demo {  
    public static void main (String [] args) {  
        String s = "Hello",  
        System.out.println (s.hashCode());  
    }  
}
```
